Open Secrets Alice Munro 2011-12-21 WINNER OF THE NOBEL PRIZE® IN LITERATURE 2013 In these eight tales, Munro evokes the devastating power of old love suddenly recollected. She tells of vanished schoolgirls and indentured frontier brides and an eccentric recluse who, in the course of one surpassingly odd dinner party, inadvertently lands herself a wealthy suitor from exotic Australia. And Munro shows us how one woman's romantic tale of capture and escape in the high Balkans may end up inspiring another woman who is fleeing a husband and lover in present-day Canada. "Open Secrets is a book that dazzles with its faith in language and in life."--New York Times Book Review

Advanced Calculus Lynn Harold Loomis 2014-02-26 An authorised reissue of the long out of print classic textbook, *Advanced Calculus* by the late Dr Lynn Loomis and Dr Shlomo Sternberg both of

Harvard University has been a revered but hard to find textbook for the advanced calculus course for decades. This book is based on an honors course in advanced calculus that the authors gave in the 1960's. The foundational material, presented in the unstarred sections of Chapters 1 through 11, was normally covered, but different applications of this basic material were stressed from year to year, and the book therefore contains more material than was covered in any one year. It can accordingly be used (with omissions) as a text for a year's course in advanced calculus, or as a text for a three-semester introduction to analysis. The prerequisites are a good grounding in the calculus of one variable from a mathematically rigorous point of view, together with some acquaintance with linear algebra. The reader should be familiar with limit and continuity type arguments and have a certain amount of mathematical sophistication. As possible introductory texts, we mention *Differential and Integral Calculus* by R Courant, *Calculus* by T Apostol, *Calculus* by M Spivak, and *Pure Mathematics* by G Hardy. The reader should also have some experience with partial derivatives. In overall plan the book divides roughly into a first half which develops the calculus (principally the differential calculus) in the setting of normed vector spaces, and a second half which deals with the calculus of differentiable manifolds.
